

Object localization

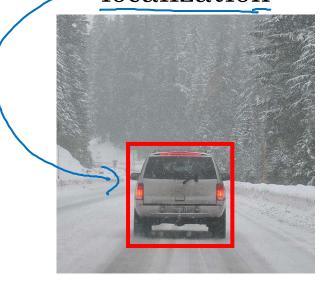

What are localization and detection?

Image classification

" Car"

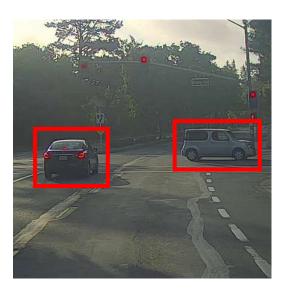

Classification with localization

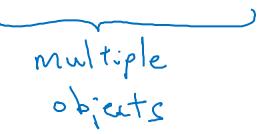

"Car

bjert

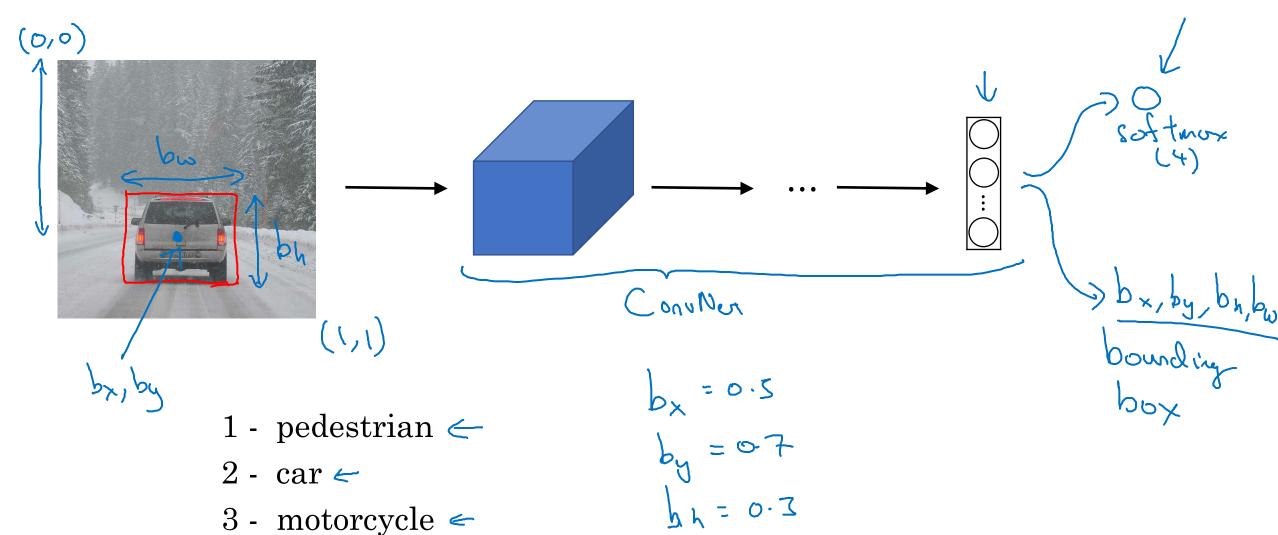

Detection

Classification with localization

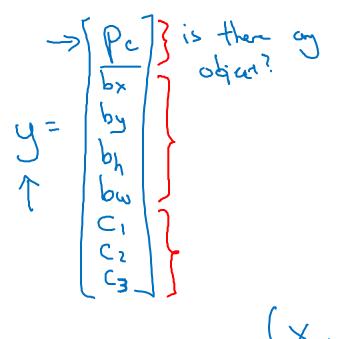

4 - background

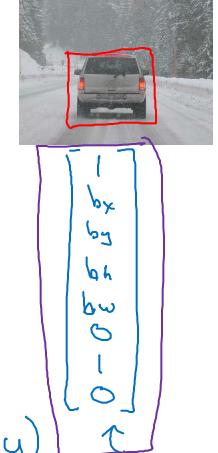

Defining the target label y

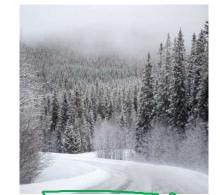

- 1 pedestrian
- 2 car <
- 3 motorcycle
- 4 background \leftarrow

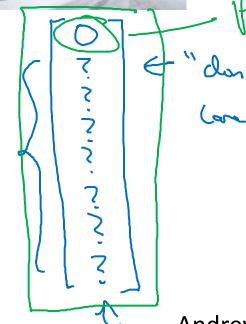

$$\begin{cases}
(\dot{y}_{1}, y_{1})^{2} + (\dot{y}_{2} - y_{2})^{2} \\
+ \dots + (\dot{y}_{8} - y_{8})^{2} & \text{if } y_{1} = 1 \\
(\dot{y}_{1} - y_{1})^{2} + (\dot{y}_{2} - y_{2})^{2}
\end{cases}$$

Need to output b_x , b_y , b_h , b_w , class label (1-4)

Andrew Ng

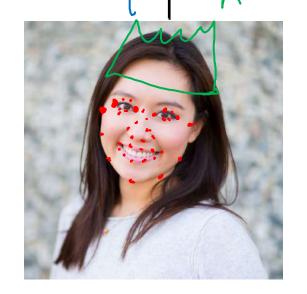

Landmark detection

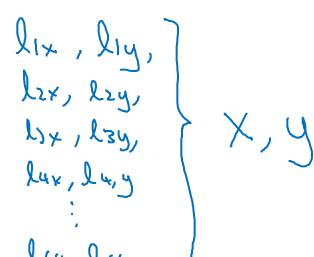

Landmark detection

 b_x , b_y , b_h , b_w

Object detection

Car detection example

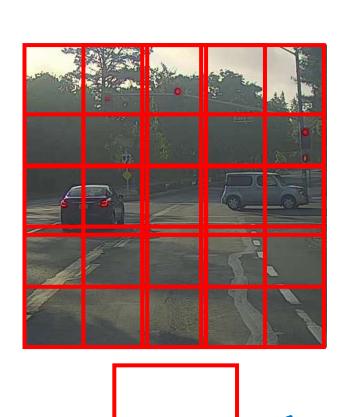

Training set:

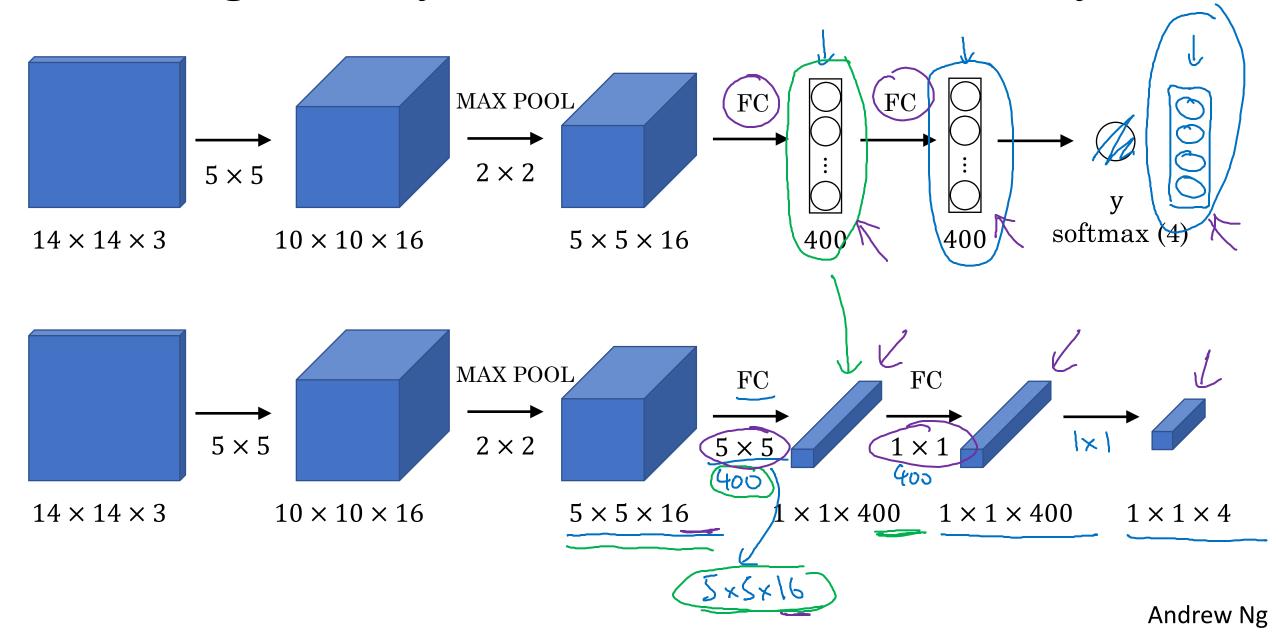

Sliding windows detection Corportation cost

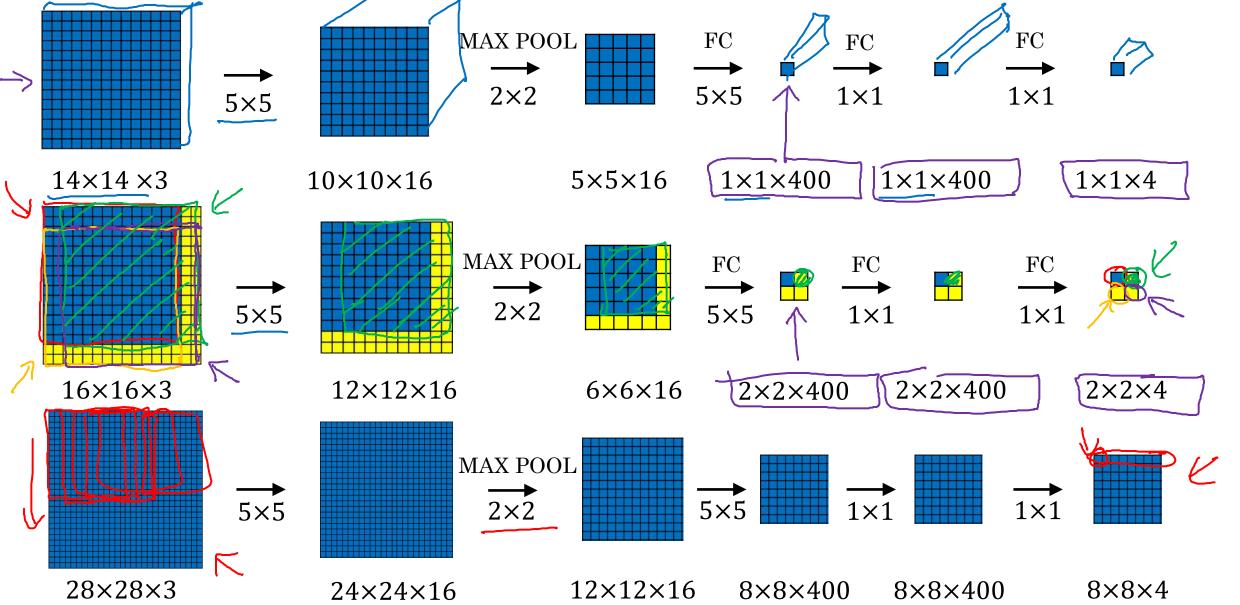

Convolutional implementation of sliding windows

Turning FC layer into convolutional layers

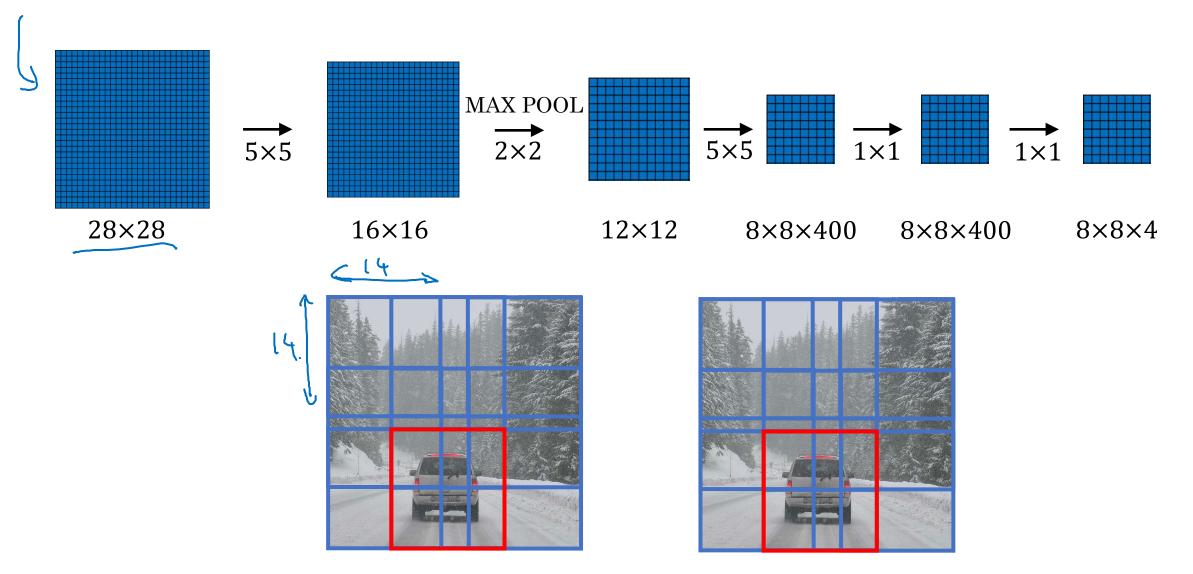

Convolution implementation of sliding windows

[Sermanet et al., 2014, OverFeat: Integrated recognition, localization and detection using convolutional networks]

Andrew Ng

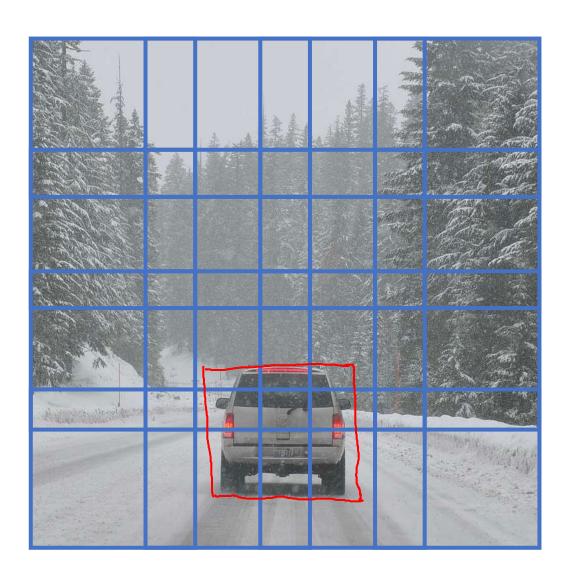

Convolution implementation of sliding windows

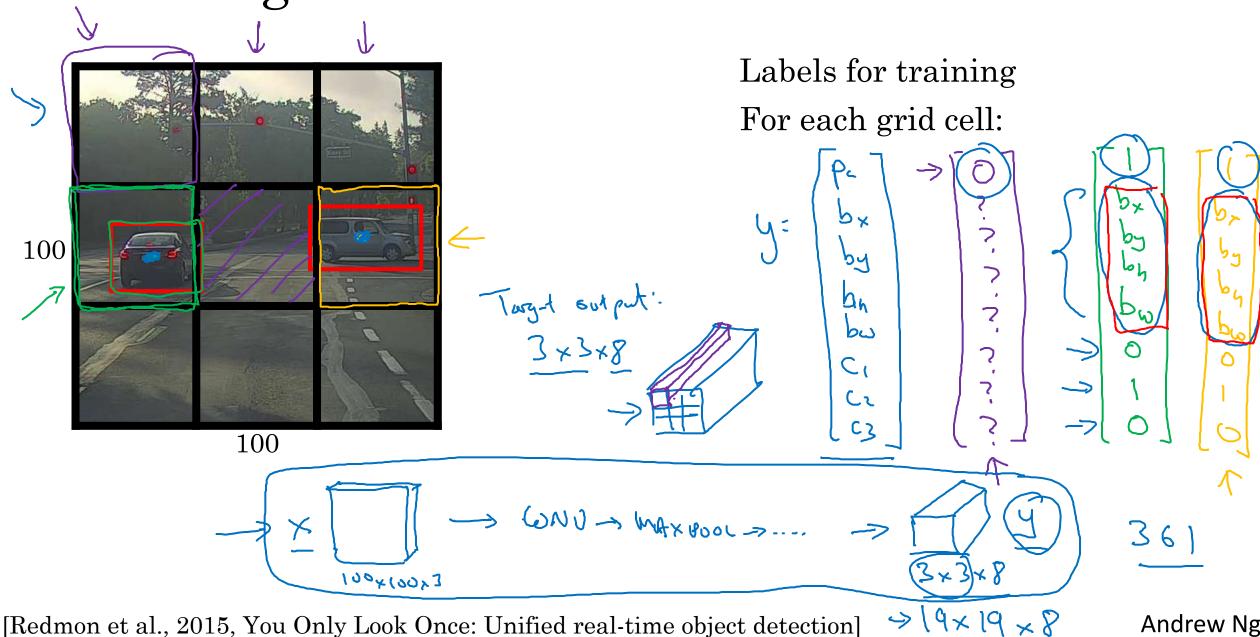

Bounding box predictions

Output accurate bounding boxes

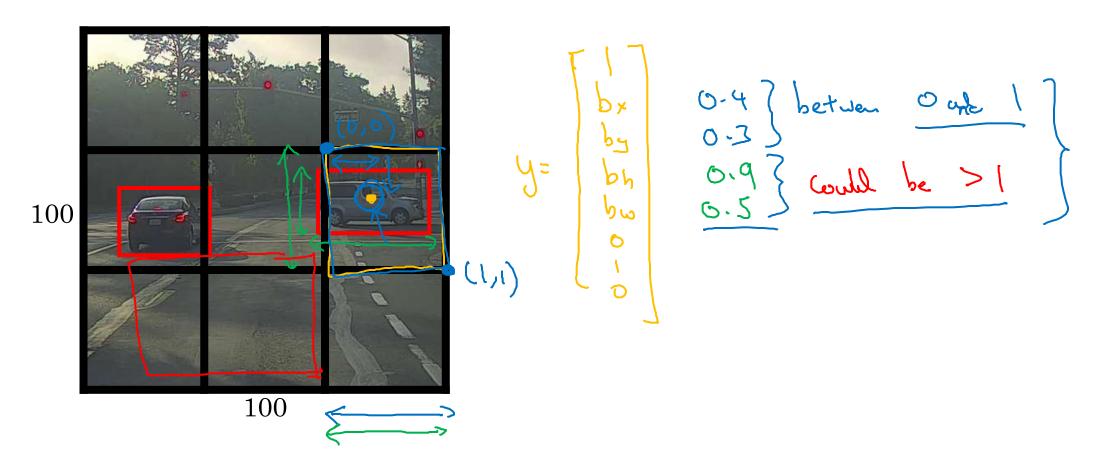

YOLO algorithm

[Redmon et al., 2015, You Only Look Once: Unified real-time object detection]

Andrew Ng

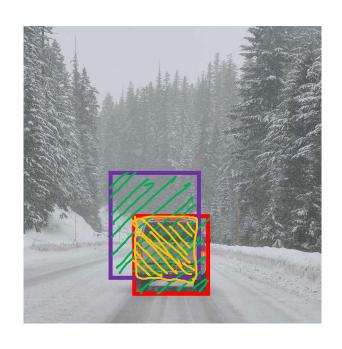

Specify the bounding boxes

Intersection over union

Evaluating object localization

More generally, IoU is a measure of the overlap between two bounding boxes.

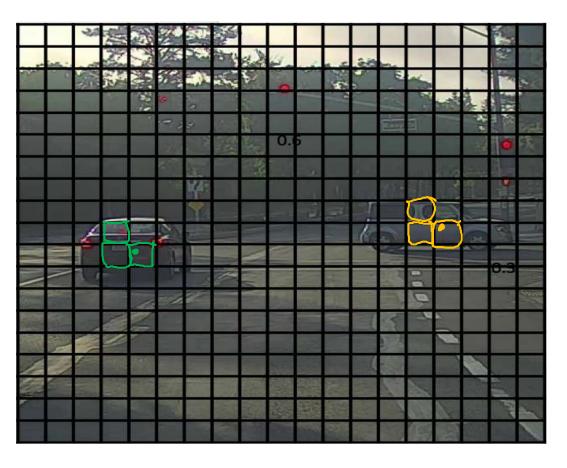

Non-max suppression

Non-max suppression example

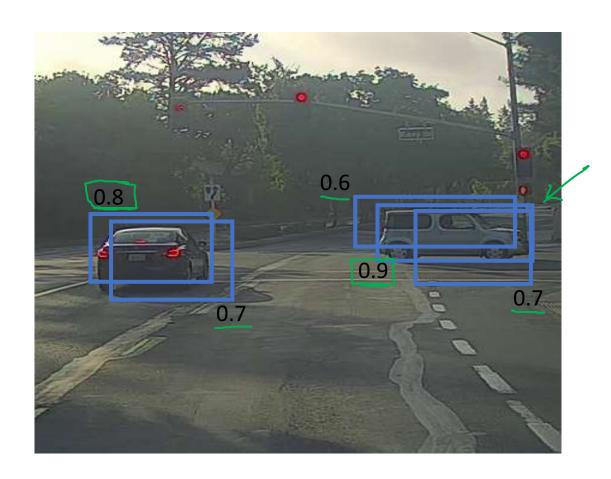

Non-max suppression example

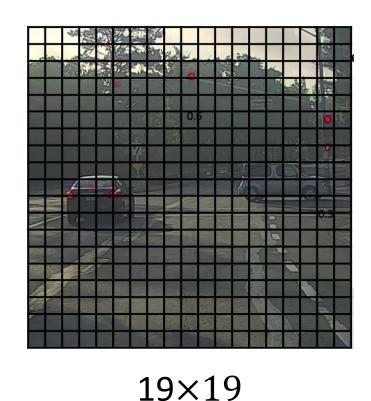

19x19

Non-max suppression example

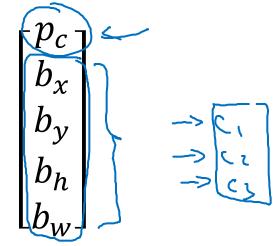

Pc

Non-max suppression algorithm

Each output prediction is:

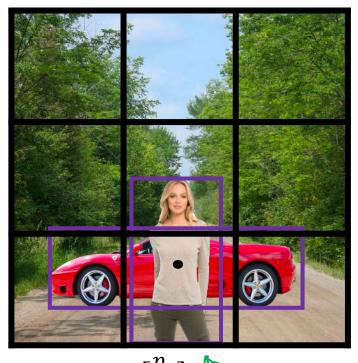

Discard all boxes with $p_c \leq 0.6$

- ->> While there are any remaining boxes:
 - Pick the box with the largest p_c Output that as a prediction.
 - Discard any remaining box with $IoU \ge 0.5$ with the box output in the previous step

Anchor boxes

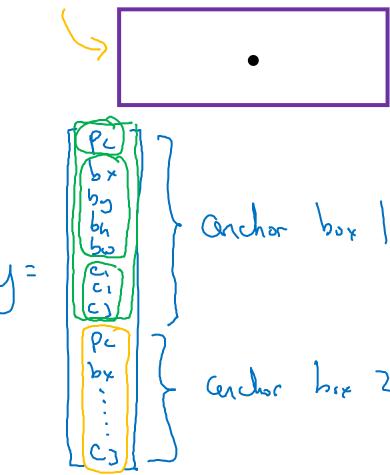

Overlapping objects:

$$\mathbf{y} = \begin{bmatrix} b_c \\ b_x \\ b_y \\ b_h \\ b_w \\ c_1 \\ c_2 \\ c_3 \end{bmatrix}$$

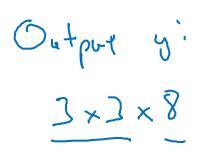

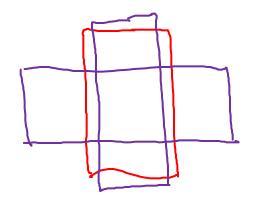

[Redmon et al., 2015, You Only Look Once: Unified real-time object detection]

Anchor box algorithm

Previously:

Each object in training image is assigned to grid cell that contains that object's midpoint.

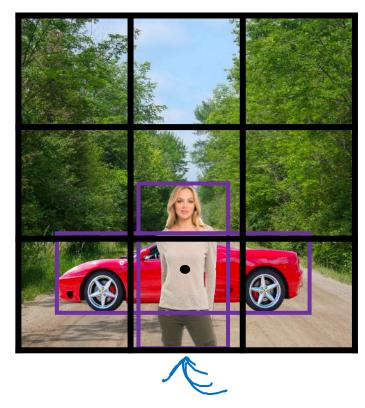

With two anchor boxes:

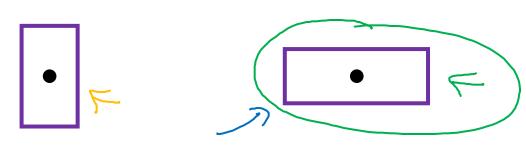

Each object in training image is assigned to grid cell that contains object's midpoint and anchor box for the grid cell with highest IoU.

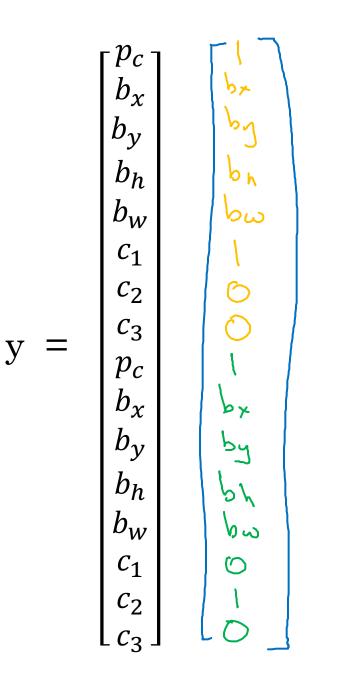

3x3x 2x8

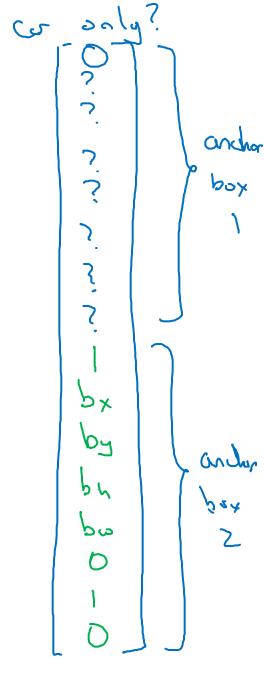

Anchor box example

Anchor box 1: Anchor box 2:

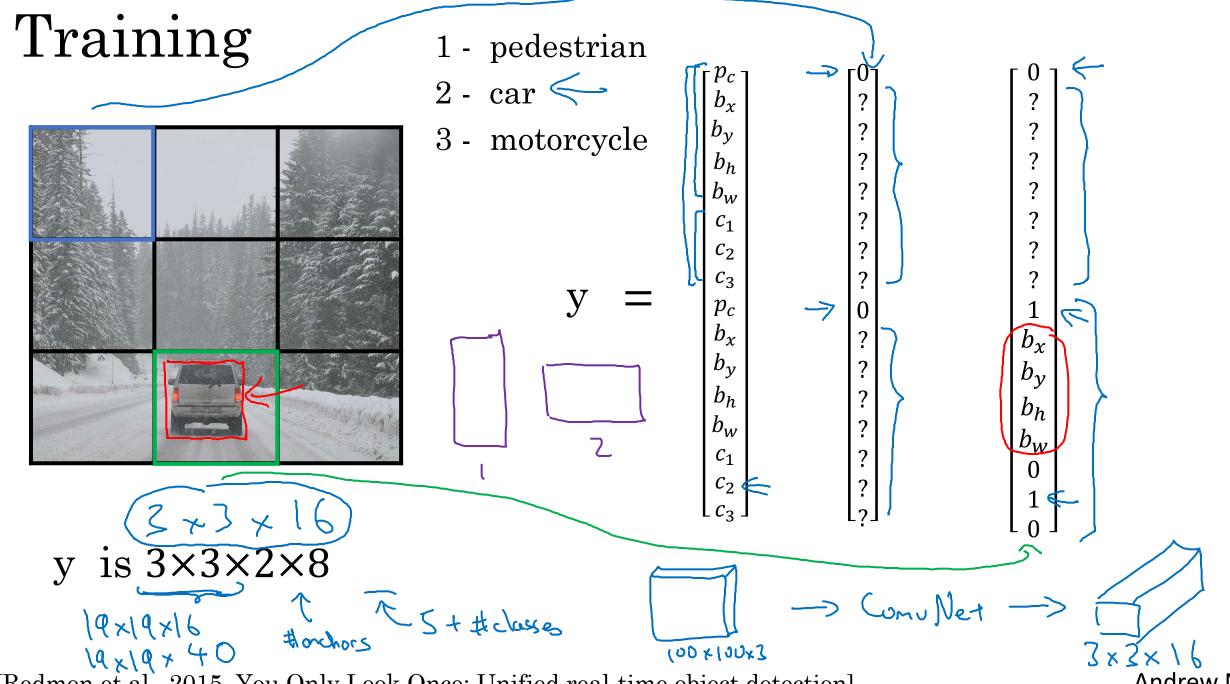

Andrew Ng

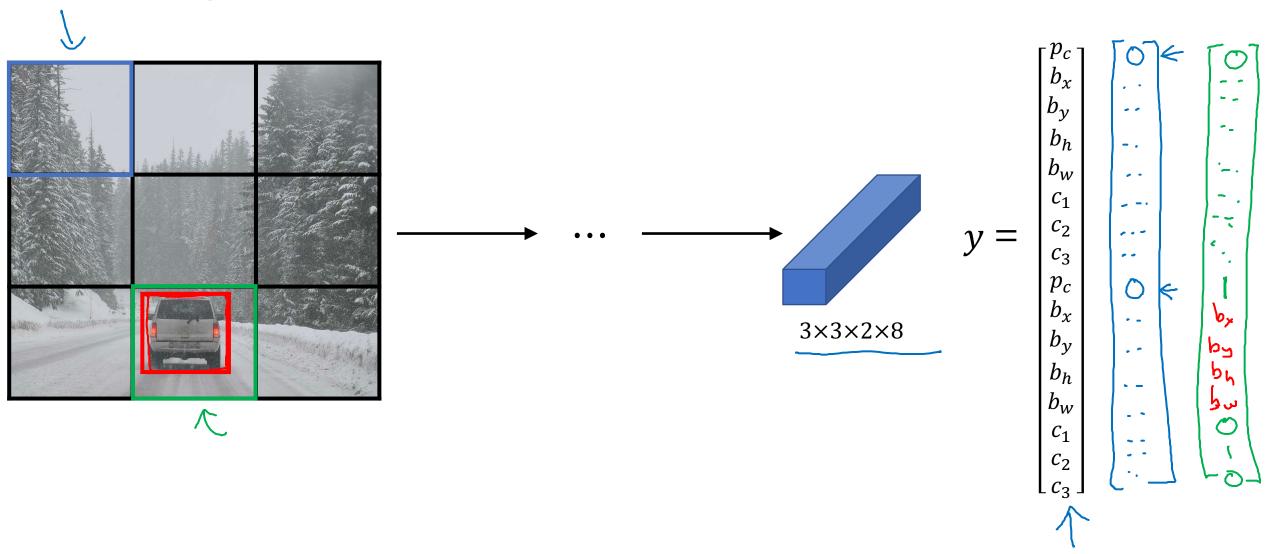

Putting it together: YOLO algorithm

[Redmon et al., 2015, You Only Look Once: Unified real-time object detection]

Andrew Ng

Making predictions

Outputting the non-max supressed outputs

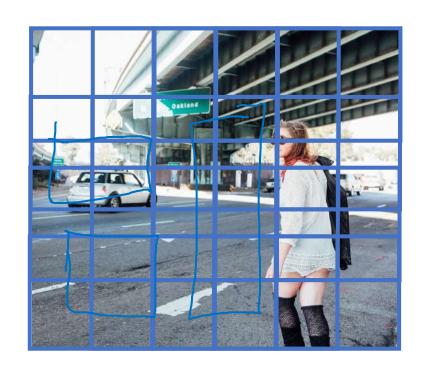

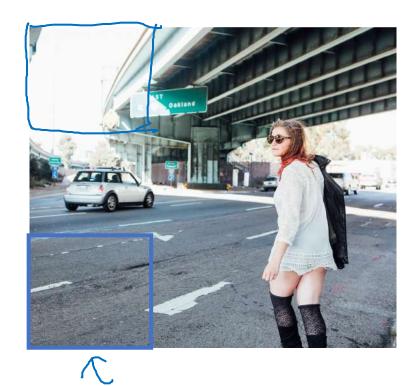

- For each grid call, get 2 predicted bounding boxes.
- Get rid of low probability predictions.
- For each class (pedestrian, car, motorcycle) use non-max suppression to generate final predictions.

Region proposals (Optional)

Region proposal: R-CNN

[Girshik et. al, 2013, Rich feature hierarchies for accurate object detection and semantic segmentation] Andrew Ng

Faster algorithms

 \rightarrow R-CNN:

Propose regions. Classify proposed regions one at a time. Output <u>label</u> + bounding box.

Fast R-CNN:

Propose regions. Use convolution implementation of sliding windows to classify all the proposed regions.

Faster R-CNN: Use convolutional network to propose regions.

[Girshik et. al, 2013. Rich feature hierarchies for accurate object detection and semantic segmentation] [Girshik, 2015. Fast R-CNN]

[Ren et. al, 2016. Faster R-CNN: Towards real-time object detection with region proposal networks]
